MBTI-FASHION VIBE NETWORK

Living Room Anchor & Compromise Bridge for Newlyweds

MADT7202 | Web & Social Network Analytics | Midterm Project

Kanyathat Rakdee | 6810424002

01 THE DECISION

As a Lead Design Strategist, shortlist a primary living-room style (the **Living Room Anchor**) and potential bridge styles for newlyweds with different MBTI labels. The results can inform furniture collection planning and a future recommendation engine.

02 WHY A NETWORK

Frequency alone does not show which MBTI categories share observed Vibe links. A **bipartite network** and weighted shortest paths identify structural bridges for pairs with no shared direct Vibe. These are patterns in coded data, not proof of psychological compatibility or customer preference.

03 DATA

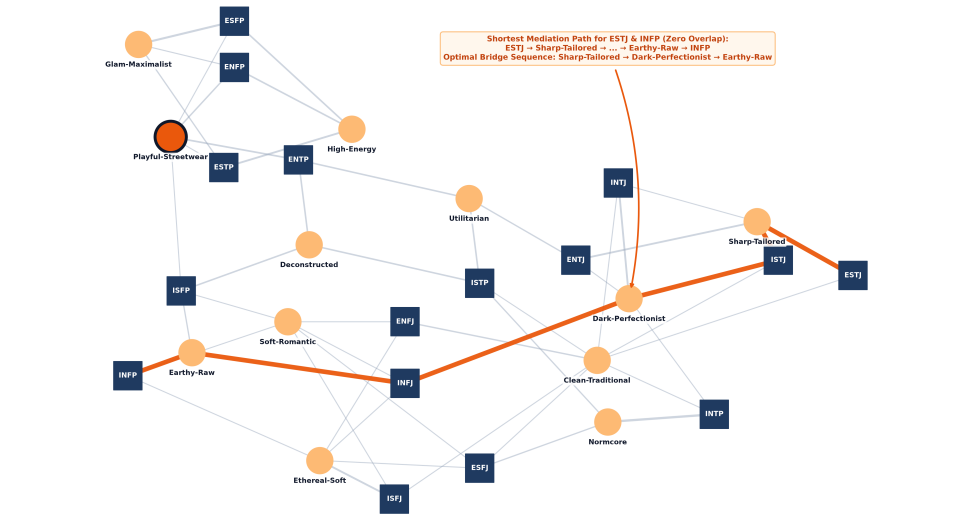

Sources	67 public TikTok lookbook images (268 coded observations) from six anonymized creator labels (A-F).
Traceability	CSV is the source of truth; 67/67 raw filenames were found. Proxy-to-pixel correspondence is not independently verified.
Period	27 September to 7 October 2026.
Coding / bias	Gemini-assisted Vibe coding; Vibe-to-Room-Style mapping is researcher-defined. 65/67 images came from four main creators.

04 GRAPH CONSTRUCTION

Nodes / edges	16 MBTI square nodes + 12 Fashion Vibe circle nodes; 28 nodes in total.
Weighting	Image-level NPMI, N = 67; shortest-path distance d = 1/NPMI for positive edges.
Pruning / overlap	Retain NPMI > 0; 51/51 observed edges retained. Separately, 58/120 MBTI pairs (48.3%) have no shared direct Vibe; this is not Bridge Load.
Sensitivity	Threshold 2: 14 edges; largest component 7 nodes; 111/113 no-overlap pairs unreachable. Threshold 3: 2 edges; largest component 3 nodes; 119/119 no-overlap pairs unreachable.

05 THE GRAPH

Figure 1. MBTI-Fashion Vibe Bipartite Network (NPMI-weighted)

Super Hub: Clean-Traditional (Degree = 8, Coverage = 28/120 pairs) | Top Bridge: Playful-Streetwear (Weighted BC = 0.3134; Bridge Load = 33.0 units)\nNo-direct-overlap MBTI pairs: 58/120 (48.3%) | Orange Path = ESTJ-INFP Shortest Path

ESTJ x INFP have zero direct overlap; selected weighted shortest-path sequence:
Sharp-Tailored -> Dark-Perfectionist -> Earthy-Raw

06 FINDINGS

HUB / ANCHOR CANDIDATE

Clean-Traditional | 23.3%

- Degree: 8
- MBTI-pair coverage: 28/120
- Weighted betweenness: 0.0456

TOP STRUCTURAL BRIDGE

Playful-Streetwear

- Weighted betweenness: 0.3134
- Bridge Load: 33.0 fractional path-load units
- Top bridge in 4 of 6 creator-removal runs

EXAMPLE MEDIATION

ESTJ x INFP

Zero direct overlap in the observed graph. Path: Sharp-Tailored -> Dark-Perfectionist -> Earthy-Raw.

07 RECOMMENDED ACTION

- Use Clean-Traditional as an anchor candidate (Classic Contemporary / Hamptons-inspired direction).
- Test Playful-Streetwear alongside Soft-Romantic and Dark-Perfectionist; do not treat a single style as a universal answer.
- Keep d = 1/NPMI as exploratory recommendation logic, subject to validation with couples.

08 WHAT WOULD CHANGE MY MIND

- Leave-One-Creator-Out: Playful-Streetwear leads in 4/6 runs; Dark-Perfectionist and Soft-Romantic lead in the other runs, so the ranking is sensitive to creator composition.
- Threshold tests fragment the graph; alternative top-bridge names under stricter thresholds are not reliable recommendations.
- A showroom A/B test with 100 couples is proposed future validation, not a completed experiment.
