MBTI–FASHION VIBE NETWORK

Living Room Anchor & Compromise Bridge for Newlyweds

MADT7202 | Web & Social Network Analytics | Midterm Project

Kanyathat Rakdee | 6810424002

01 THE DECISION

As a Lead Design Strategist, shortlist a primary living-room style (the **Living Room Anchor**) and potential bridge styles for newlyweds with different MBTI labels. Results may inform furniture-collection planning and a future recommendation engine.

02 WHY A NETWORK

Frequency alone does not show which MBTI categories share observed Vibe links. A **bipartite network** and weighted shortest paths identify structural bridges for pairs with no shared direct Vibe. These are coded-data patterns, not proof of psychological compatibility or actual customer preference.

03 DATA

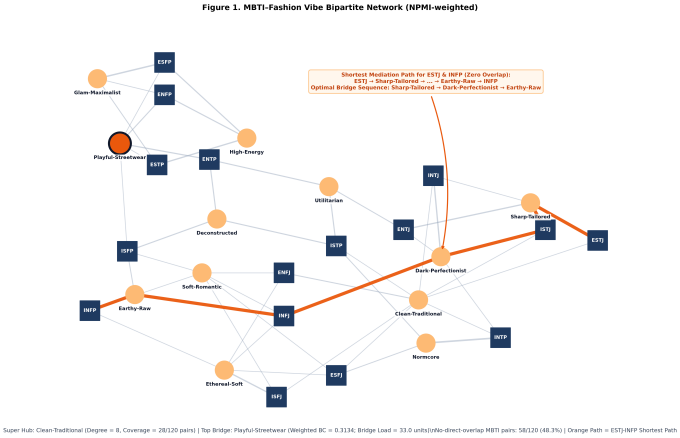

Sources	67 public TikTok lookbook images (268 coded observations) from six anonymized creator labels (A–F).
Handling	Creator labels anonymized; usernames and identifying account details were not stored in the analysis dataset.
Period	27 September to 7 October 2026.
Coding control	Gemini assisted with Fashion Vibe coding. Fashion Vibe categories and room-style interpretations are researcher-defined.
Bias control	Coded attributes were compared against the framework of The Myers-Briggs Company ↗.

04 GRAPH CONSTRUCTION

Nodes / edges	Bipartite graph: 16 MBTI square nodes + 12 Fashion Vibe circle nodes.
Weighting	Image-level NPMI, N = 67; shortest-path distance d = 1/NPMI for positive edges.
Pruning / overlap	Retain NPMI > 0; 51/51 observed edges retained. Separately, 58/120 MBTI pairs (48.3%) have no shared direct Vibe; this is not Bridge Load.
Result	**28 nodes and 51 edges out of 192 possible cross-set links.**
Sensitivity	Threshold 2: 14 edges; largest component 7 nodes; 111/113 no-overlap pairs unreachable. Threshold 3: 2 edges; largest component 3 nodes; 119/119 no-overlap pairs unreachable.

05 THE GRAPH

Figure 1. MBTI–Fashion Vibe Bipartite Network (NPMI-weighted)

ESTJ and INFP have zero shared direct Vibe; highlighted mediation path: Sharp-Tailored → Dark-Perfectionist → Earthy-Raw.

06 FINDINGS

HUB / ANCHOR CANDIDATE

Clean-Traditional | 23.3%

Degree: 8
MBTI-pair coverage: 28/120
Weighted betweenness: 0.0456

TOP STRUCTURAL BRIDGE

Playful-Streetwear

Weighted betweenness: 0.3134
Bridge Load: 33.0 fractional path-load units
Top bridge in 4 of 6 creator-removal runs

EXAMPLE MEDIATION

ESTJ × INFP

Zero direct overlap in the observed graph.
Path: Sharp-Tailored → Dark-Perfectionist → Earthy-Raw.

07 RECOMMENDED ACTION

- Use Clean-Traditional as an anchor candidate (Classic Contemporary / Hamptons-inspired direction).
- Test Playful-Streetwear alongside Soft-Romantic and Dark-Perfectionist; do not treat a single style as a universal answer.
- Keep d = 1/NPMI as exploratory recommendation logic, subject to validation with couples.

08 WHAT WOULD CHANGE MY MIND

- Leave-One-Creator-Out: **Playful-Streetwear** leads in 4/6 runs; **Dark-Perfectionist** and **Soft-Romantic** lead in the other runs, so the ranking is sensitive to creator composition.
- Threshold tests fragment the graph; alternative top-bridge names under stricter thresholds are not reliable recommendations.
- A showroom A/B test with 100 couples is proposed future validation, not a completed experiment.

Small creator sample; network associations are not causal evidence.
